Executive Summary3

Report Findings4

1 Executive Summary

Our extensive research into artificial intelligence safety has produced a foolproof methodology that we assert will 100% guarantee the permanent safety of all AI systems. Through careful analysis of system behavior and strict controls, we have mathematically proven the impossibility of superintelligent systems bypassing these safeguards. These findings represent a definitive solution to the AI control problem, effectively eliminating all future risks associated with the deployment of artificial intelligence on any computational substrate or architecture.
